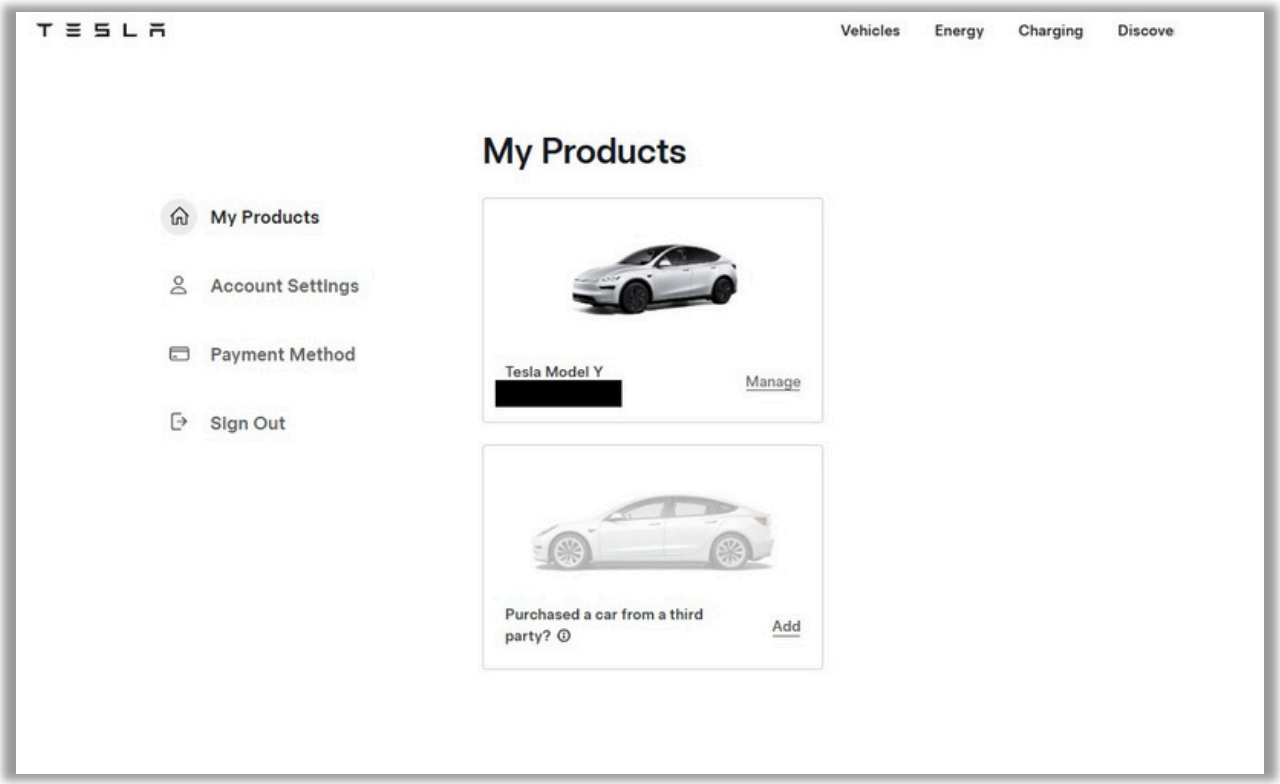
Easy Method:

Run script via **Google Collab** *(Requires google account)*

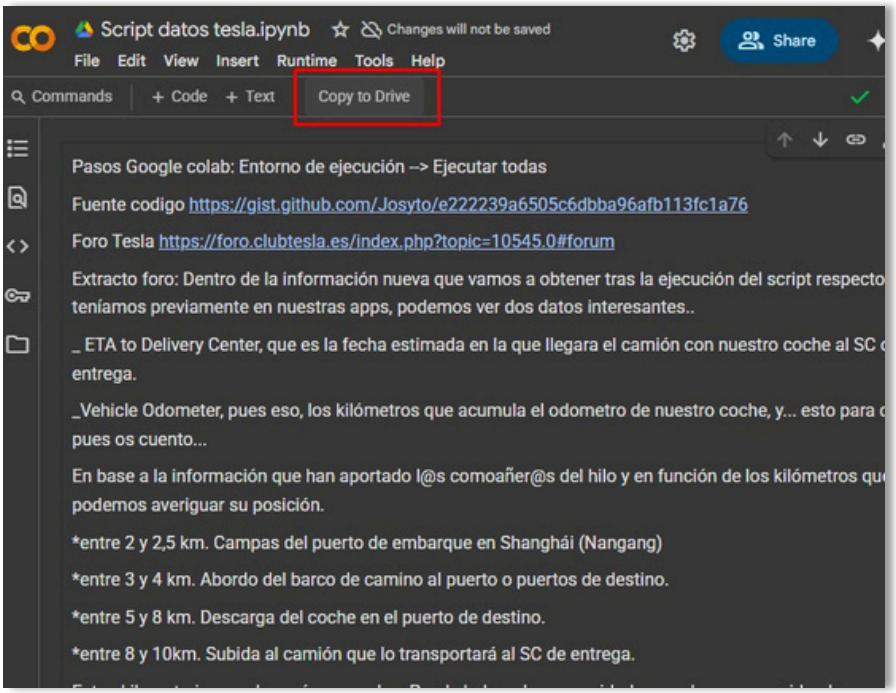
Step 1: Login to your Tesla account via Web browser (PC)

- Leave it Open

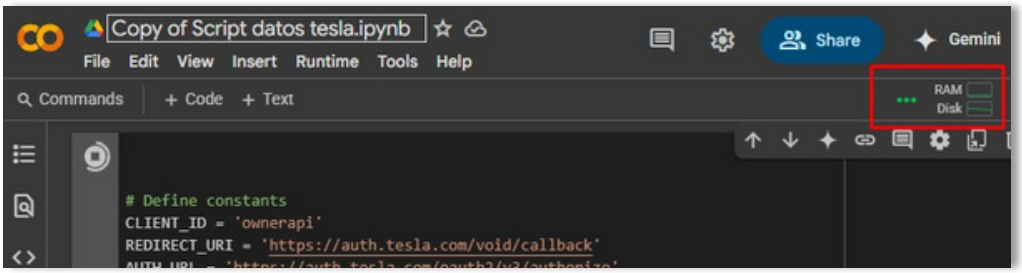


Step 2: Run script via Google Collab

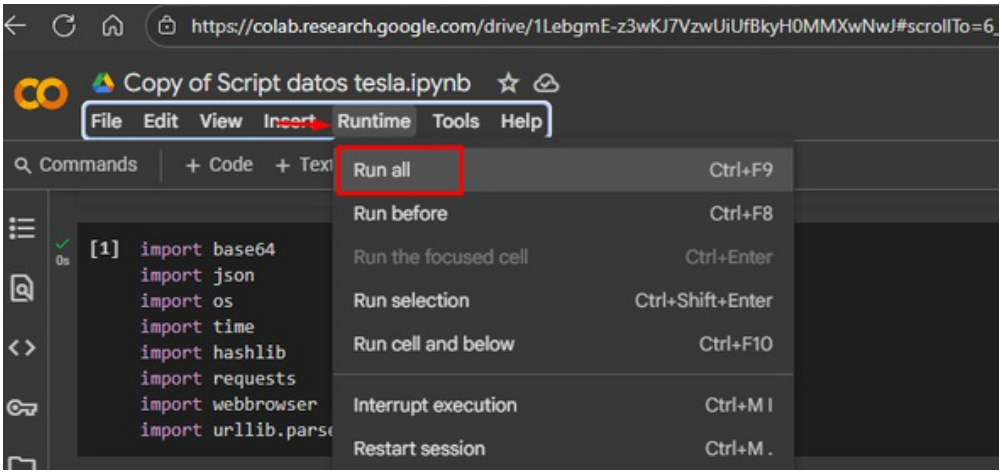
- On the other tab, go to ***https://colab.research.google.com/drive/1Jo36FWC-97AuJNDqWM_k-G9NctJJ7uS8#scrollTo=nQ18IuUG52WH***
- Recommended: Copy this script to your google collab drive



Once copied – run the script and make sure the status is connected like this



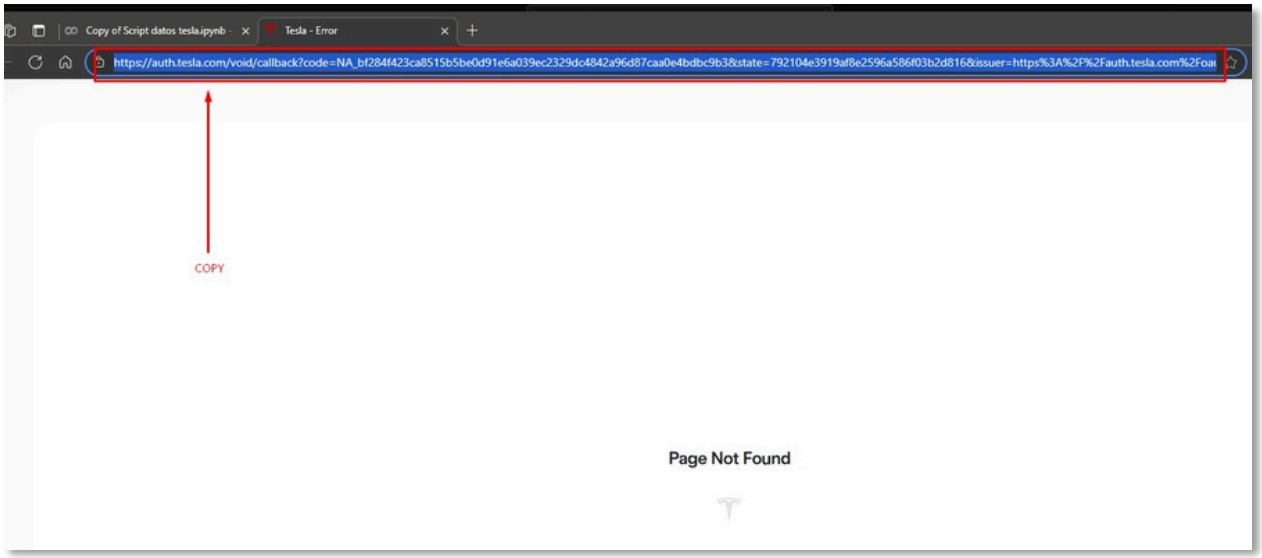
- UnderRuntime Select Run all



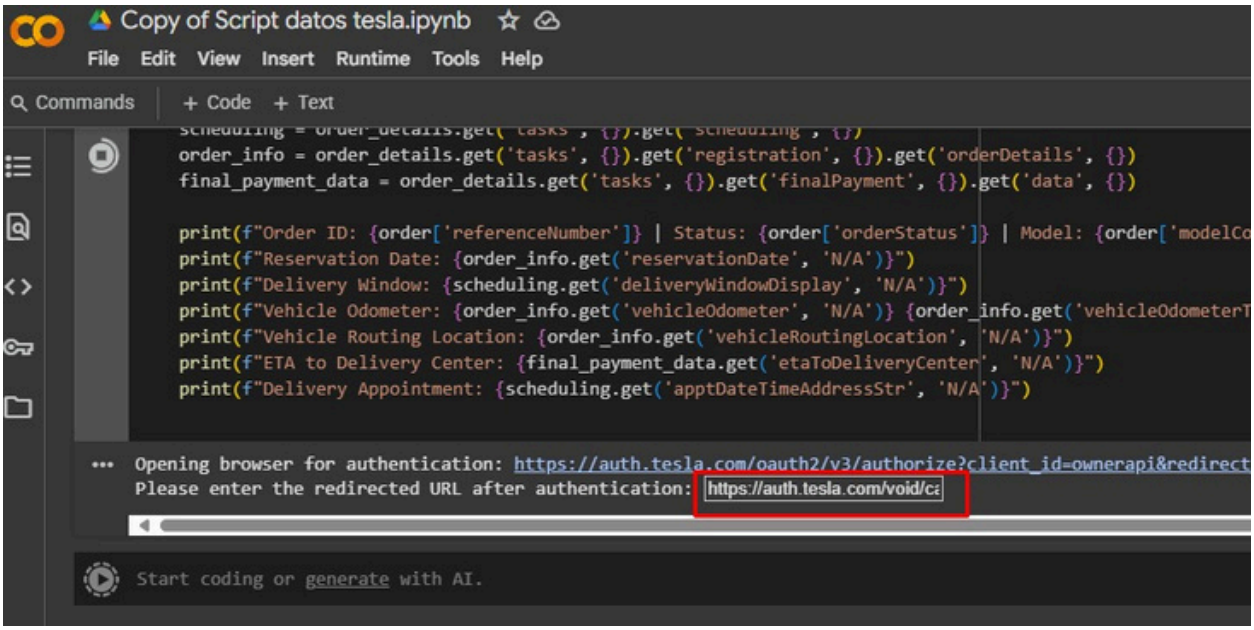
Step 3:

1. Scroll down and click on the highlighted link below

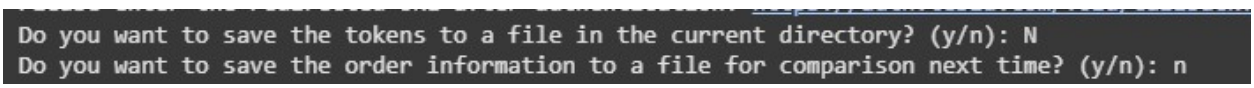
2. You'll get redirected to the link as shown below. Copy the address



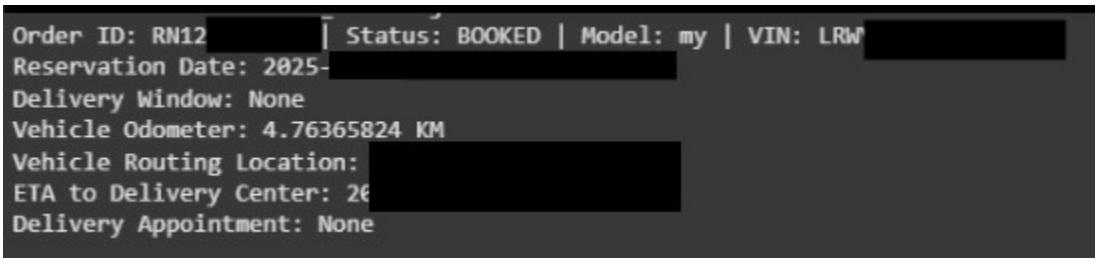
3. Back to the script, paste the address URL to the highlighted field shown below and press **enter**



4. You will be prompted to confirm whether you want to save the tokens or order information to a file. You can choose **N** for both.



5. Script will display data from the extracted information via API



Notes:

- **ETA to Delivery Center:** This is the estimated date when the truck carrying our car will arrive at the Service Center (SC) or delivery point.
- **Vehicle Odometer:** Basically, the kilometers recorded on the odometer of your car. And… what is this useful for? Well, let me explain…

Based on the information shared by forum members and depending on the number of kilometers, we can figure out the car's location:

- **Between 2 and 2.5 km:** Storage yards at the port of departure from Shanghai
- **Between 3 and 4 km:** Onboard the ship en route to the destination port(s)
- **Between 5 and 8 km:** Car unloaded at the destination port
- **Between 8 and 10 km:** Loaded onto the truck that will transport it to the delivery SC

These kilometer ranges are the most typical. Some units may have slightly higher mileage, but the movement pattern applies to all vehicles. If the kilometers change, it means the car has moved.
